#### Keywords:

Strong nuclear gravity, nuclear elementary charge, strong coupling constant, nuclear stability range, binding energy of isotopes, magic proton numbers.

DOI: 10.15415/jnp.2019.6.02.0142-160

#### ABSTRACT

With reference to our earlier published views on large nuclear gravitational constant  $G_s$ , nuclear elementary charge  $e_s$  and strong coupling constant  $\alpha_s \cong e/e_s^{-2}$ , in this paper, we present simple relations for nuclear stability range, binding energy of isotopes and magic proton numbers. Even though 'speculative' in nature, proposed concepts are simple to understand, easy to implement, result oriented, effective and unified. Our proposed model seems to span across the Planck scale and nuclear scale and can be called as SPAN model (STRANGE\* physics of atomic nucleus).

**Summary:** Probable range of stable mass numbers can be estimated with  $A_s \cong \left[Z + \sqrt{1/\alpha_s} \pm 1\right]^s$  where  $x \cong 1.2$  for  $Z \approx 3$  to 100 and  $x \cong 1.19$  for  $Z \ge 100$ .  $A_s$  can also be expressed as,  $A_s \cong 2Z + kZ^2$  where  $k \cong \left[4\pi\varepsilon_0 \ \hbar/2 \ ^2 m_e c^2/e^2 G_s m_p^3\right] \cong 0.006333$ . Energy coefficient being  $\left[e_s^2/8\pi\varepsilon_0 \ G_s m_p/c^2\right] \approx 10.06$  MeV, for  $Z \approx 5$  to 118, nuclear binding energy can be understood/fitted with two terms as,  $B_{A_s} \cong A_s - \left[kA_sZ/2.531 + 3.531\right] \times 10.06$  MeV where  $\ln 1/\sqrt{k} \cong m_n - m_p/m_e \cong 2.531$ . By considering a third term of the form  $\left[A_s - A^2/A_s\right]$ , binding energy of isotopes of Z can be fitted approximately. It needs further investigation. See section 12 for an in-depth discussion.

#### 1. Introduction

With reference to 'Strong (nuclear) gravity' [1-20], if  $G_f \approx 10^{38} G_N$  and with reference to our recent symposium proceedings and journal publications [21-37], we try to refine our proposed concepts with the following three assumptions for a better understanding on nuclear stability range, binding energy of isotopes and magic proton numbers. We consider,

$$G_f \cong G_s \cong \frac{4\pi\varepsilon_0 h^2 c^2 m_e}{e^2 m_p^3} \cong 3.329561 \times 10^{28} \text{ m}^3 \text{kg}^{-1} \text{sec}^{-2}.$$

#### 2. Assumptions

- 1) Nuclear charge radius can be expressed as  $R_0 \cong \frac{2G_s m_p}{c^2} \cong 1.23929083 \text{ fm}$
- 2) Strong coupling constant can be expressed as,  $\alpha_s = \left(\frac{\hbar c}{G_s m_p^2}\right)^2 = 0.1151937353$
- 3) There exists a nuclear elementary charge,  $e_s \cong \frac{e}{\sqrt{\alpha_s}} \cong \left(\frac{G_s m_p^2}{\hbar c}\right) e \cong 4.720586027 \times 10^{-19} \text{ C}$

#### 3. Semi empirical relations and applications

- 1) Proton magnetic moment can be expressed as  $\mu_p \cong \frac{e_s \hbar}{2m} \cong \frac{eG_s m_p}{2c} \cong 1.488142 \times 10^{-26} \text{ J.T}^{-1}$
- 2) Ignoring the negative sign, neutron magnetic moment can be expressed as  $\mu_n \cong \frac{(e_s e)\hbar}{2m_n} \cong 9.817102 \times 10^{-27} \text{ J.T}^{-1}$ .
- 3) Nuclear unit radius can be expressed as,  $R_0 \cong \frac{2G_s m_p}{c^2}$   $\cong \left(\frac{e_s}{e}\right) \left\{\frac{\hbar}{m_o c} + \frac{\hbar}{m_o c}\right\}$
- 4) Root mean square nuclear charge radii can be expressed as,

$$R_{(Z,A)} \cong \left\{ Z^{1/3} + \left( \sqrt{Z(A-Z)} \right)^{1/3} \right\} \left( \frac{G_s m_p}{c^2} \right)$$

5) Nuclear potential energy can be understood with,

$$\cong \frac{e_s^2}{4\pi\varepsilon_0 \left(G_s m_s/c^2\right)} \cong 20.1734 \text{ MeV}$$

6) Nuclear binding energy can be understood with,

\*STRANGE: Salam/Sinha/Sivaram/Sabbatta, Tennakone, Rutherford, Avagodaro, Newton, Gamow, Einstein etc.

$$\frac{e^{2}G_{s}m_{p}^{3}}{8\pi\varepsilon_{0}\hbar^{2}} \cong \frac{e_{s}e}{8\pi\varepsilon_{0}\left(\hbar/m_{p}c\right)} \cong \frac{e_{s}^{2}}{8\pi\varepsilon_{0}\left(G_{s}m_{p}/c^{2}\right)}$$

≅10.0867 MeV

7) With reference to  $(\hbar/2)$ , a useful quantum energy constant can be expressed as,  $E_{(\hbar/2)} \cong \left(\frac{e^2 G_s m_p^3}{4\pi\varepsilon_0 (\hbar/2)^2}\right) \cong 80.6934 \text{ MeV}$ 

8) Close to magic and semi magic proton numbers, nuclear binding energy seems to approach  $\left[2.531\left(n+\frac{1}{2}\right)\right]^2 10.0 \text{ MeV where } n = 0,1,2,3,... \text{ and } (m_n - m_n/m_n) = 2.531.$ 

9) Characteristic melting temperature associated with proton can be expressed as,  $T_{proton} \cong \frac{\hbar c^3}{8\pi k_B G_c m_n} \cong 0.15 \times 10^{12} \text{ K}$ 

10) Characteristic nuclear neutral mass unit [33] can be expressed as,  $\sqrt{\frac{\hbar c}{G_s}} \cong 546.62 \, \mathrm{MeV/c^2}$ . It can also be considered as a characteristic dark matter constituent [13]. See relation (26) and Table 8 of section-12 for the estimated basic baryonic mass spectrum.

#### 4. Neutron-proton mass difference

Neutron-proton mass difference can be understood with:

$$\left(\frac{m_{n}c^{2} - m_{p}c^{2}}{m_{e}c^{2}}\right) \cong \ln \sqrt{\frac{E_{(\hbar/2)}}{m_{e}c^{2}}} \cong \ln \sqrt{\frac{4e^{2}G_{s}m_{p}^{3}}{4\pi\varepsilon_{0}\hbar^{2}m_{e}c^{2}}} \quad (4)$$

#### 5. Neutron life time

Neutron life time  $t_n$  can be understood with the following relation:

$$t_n \cong \exp\left(\frac{E_{(\hbar/2)}}{(m_n - m_p)c^2}\right) \times \left(\frac{\hbar}{m_n c^2}\right) \cong 877.3 \text{ sec}$$
 (5)

This value can be compared with recommended value of  $(878.5\pm0.8)$  sec.

#### 6. Understanding proton-neutron stability

Let, 
$$\left(\frac{m_e c^2}{E_{(\hbar/2)}}\right) \cong \left(\frac{4\pi \varepsilon_0 \hbar^2 m_e c^2}{4e^2 G_s m_p^3}\right) \cong k \cong 0.0063326$$
 (6)

Quantitatively, we noticed that,

$$\frac{e_s^2}{4\pi\varepsilon_0 G_s m_p m_e} \cong 4\pi^2 \cong \frac{1}{4k}$$

$$\exp\left(\frac{m_n - m_p}{m_e}\right) \cong 4\pi \cong \sqrt{\frac{1}{k}}$$
(7)

The new factor k needs a clear interpretation and we are working on that for its scope and applicability. It can be considered as a result oriented number connected with nuclear stability and binding energy.

Stable mass number  $A_s$  of Z can be estimated with the following simple relations [38],

$$A_s \cong (N_s + Z) \cong 2Z + kZ^2 \cong 2Z + 0.0063326(Z)^2$$
 (8)

$$A_s \cong \left[ Z + \sqrt{(1/\alpha_s)} \right]^{1.2} \cong \left[ Z + 2.9463 \right]^{1.2}$$
 (9)

where  $(e/e_s)(1/k)^{1/4} \cong (\alpha_s)^{1/2}(1/k)^{1/4} \cong 1.2$ . It can be called as 'power factor of stability'.

Proton number Z associated with stable  $A_s$  can be estimated with the following simple relations,

$$Z \cong \frac{\sqrt{1 + kA_s} - 1}{k}$$
 Or  $Z \cong \frac{A_s}{1 + \sqrt{1 + kA_s}}$  (10)

#### 7. Understanding proton-neutron stability range

Considering relation (8), it seems possible to find the best possible range of  $A_s$ . We noticed that,

$$(A_s)_{mean} \cong \left[ Z + \sqrt{(1/\alpha_s)} \right]^{1.2}$$

$$(A_s)_{low}^{up} \cong \left[ Z + \left( \sqrt{(1/\alpha_s)} \pm 1 \right) \right]^{1.2}$$

$$(11)$$

Lower stable  $A_s$  can be estimated with,

$$(A_s)_{low} \cong \left[ Z + \left( \sqrt{(1/\alpha_s)} - 1 \right) \right]^{1.2} \cong \left[ Z + 1.9463 \right]^{1.2}$$
 (12)

Upper stable  $A_s$  can be estimated with,

$$(A_s)_{up} \cong \left[Z + \left(\sqrt{(1/\alpha_s)} + 1\right)\right]^{1.2} \cong \left[Z + 3.9463\right]^{1.2}$$
 (13)

See Table 1 for the estimated range of stable mass numbers for Z=3 to 100. With\_even-odd corrections data can be refined.

Considering a factor of 1.19 in place of 1.2, stable mass numbers of super heavy elements can be fitted. For Z=116, estimated stable mass number range seems to be 292 to 298 and its experimental mass range is 291 to 294 [39]. See Table 2 for a comparison.

**Table 2:** Estimated range of stable mass numbers for Z=101 to 118 with a power factor of 1.19

## 8. Nuclear binding energy close to stable mass numbers

Based on the new integrated model proposed by N. Ghahramany et al [40,41],

$$B(Z,N) = \left\{ A - \left( \frac{(N^2 - Z^2) + \delta(N - Z)}{3Z} + 3 \right) \right\} \frac{m_n c^2}{\gamma}$$
 (14)

where,  $\gamma = \text{Adjusting coefficient } \approx (90 \text{ to } 100)$ 

if 
$$N \neq Z$$
,  $\delta(N-Z) = 0$  and if  $N = Z$ ,  $\delta(N-Z) = 1$ .

Readers are encouraged to see references there in [40,41] for derivation part. Point to be noted is that, close to the beta stability line,  $\left[\frac{N^2-Z^2}{3Z}\right]$  takes care of the combined effects of coulombic and asymmetric effects. In this context, we propose that,

$$\frac{m_{\scriptscriptstyle n}c^2}{\gamma} \cong \frac{m_{\scriptscriptstyle n}c^2}{(90 \text{ to } 100)} \cong \text{Constant}$$

$$\cong \frac{e_{\scriptscriptstyle s}^2}{8\pi\varepsilon_{\scriptscriptstyle 0} (G_{\scriptscriptstyle s}m_{\scriptscriptstyle p}/c^2)} \cong 10.09 \text{MeV}$$
(15)

Proceeding further, with reference to relation (7), it is also possible to show that, for  $Z \cong (40 \text{ to } 83)$ , close to the beta stability line,

$$\left[\frac{N_s^2 - Z^2}{Z}\right] \cong kA_s Z \tag{16}$$

$$\left[\frac{N_{s}^{2}-Z^{2}}{3Z}\right] \cong \frac{kA_{s}Z}{3} \tag{17}$$

Based on the above relations and close to the stable mass numbers of  $(Z \approx 5 \text{ to } 118)$ , with a common energy coefficient of 10.06 MeV, we propose two terms for fitting and understanding nuclear binding energy.

First term helps in increasing the binding energy and can be considered as,

Term 
$$1 = A_s \times 10.06 \text{ MeV}$$
 (18)

Second term helps in **decreasing** the binding energy and can be considered as,

Term\_2 = 
$$\left(\frac{kA_sZ}{2.531} + 3.531\right) \times 10.06 \text{ MeV}$$
 (19)

where 
$$\begin{cases} \left(\frac{\left(m_{n}-m_{p}\right)c^{2}}{m_{e}c^{2}}\right) \cong \ln\left(\frac{1}{\sqrt{k}}\right) \cong 2.531. \\ 3.531 \cong 1 + 2.531 \cong 1 + \ln\left(\frac{1}{\sqrt{k}}\right) \end{cases}$$

Thus, binding energy can be fitted with,

$$B_{A_s} \cong \left\{ A_s - \left( \frac{kA_s Z}{2.531} + 3.531 \right) \right\} \times 10.06 \text{ MeV}$$
 (20)

See the following Figure 1. Dotted red curve plotted with relations (7) and (20) can be compared with the green curve plotted with the standard semi empirical mass formula (SEMF) [38,42].

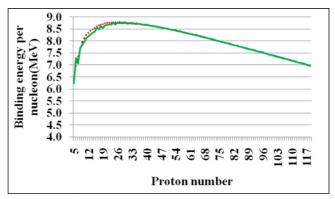

Figure 1: Binding energy per nucleon close to stable mass numbers of Z = 5 to 118

For medium and heavy atomic nuclides, fit is excellent. It seems that some correction is required for light atoms. See Table 3 for the estimated data.

**Table 3:** Nuclear Binding energy close to stable mass numbers of Z = 5 to 118

#### 9. Nuclear binding energy of isotopes of Z

We are working on understanding and estimating the binding energy of mass numbers above and below the stable mass numbers.

With trial and error, we have developed a third term of the form  $\left[\frac{\left(A_s - A\right)^2}{A_s}\right] \times 10.06$  MeV. Using this

term, approximately, it is possible to fit the binding energy of isotopes in following way.

$$B_A \cong \left\{ \left[ A - \left( \frac{kAZ}{2.531} + 3.531 \right) \right] - \left[ \frac{\left( A_s - A \right)^2}{A_s} \right] \right\} \times 10.06 \text{ MeV}$$
 (21)

See Figure 2 and Table 4 for the estimated isotopic

binding energy of Z=50. Dashed red curve plotted with relations (7) and (21) can be compared with the green curve plotted with total binding energy of Thomas-Fermi model [42].

For Z=50 and A=100 to 130, with reference to total binding energy of Thomas-Fermi model [42], there is no much more difference in the estimation of binding energy. When (A>130), binding energy seems to be increasing and when (A>170), binding energy seems to be decreasing rapidly. It needs further study and refinement.

See Figures 3 to 10 for the estimated isotopic binding energies of Z=22, 32, 42, 52, 62, 72, 82 and 92. Dashed red curve plotted with relations (7) and (21) can be compared with the green curve plotted with the semi empirical formula.

## 10. Understanding the binding energy of light atomic nuclides

It is well established that, in light atomic nuclides, coulombic interaction seems to play a key role in reducing the binding energy. Based on this concept, starting from Z=2 to Z=30, close to stable mass numbers, binding energy can be expressed by the following relations.

$$B_{A_s} \cong \left[ A_s - A_s^{\frac{1}{3}} \right] (10.06 - 0.71) \text{ MeV}$$
  
 $\cong \left[ A_s - A_s^{\frac{1}{3}} \right] 9.35 \text{ MeV}$  (22)

See the following Table 6.

**Table 6:** Binding energy of Z = 2 to 30 based on coulombic correction

Proton number	Mass number	Est. BE (MeV)	SEMF BE (MeV) [38]	Error (MeV)
2	4	22.6	22.0	-0.5
3	6	39.1	26.9	-12.2
4	8	56.1	52.9	-3.2

30	66	579.3	577.9	-1.4

#### 11. Understanding magic proton numbers

It may be noted that, the nuclear magic numbers, as we know in stable and naturally occurring nuclei, consist of two different series of numbers. The first series -2, 8, 20 is attributed to the harmonic-oscillator (HO) potential, while the second one - 28, 50, 82 and 126 is due to the spin—orbit (SO) coupling force [43-46]. In this context, our bold idea is that, atoms are exceptionally stable when their nuclear binding energy approaches,

$$B_{A} \cong \left[ 2.531 \left( n + \frac{1}{2} \right) \right]^{2} 10.06 \text{ MeV}$$
 (23)

Based on point 5 of section-3, close to stable mass numbers of  $Z \approx (2 \text{ to } 100)$ , magnitude of nuclear binding energy can be expressed by a relation of following form.

$$B_{A_{s}} \approx \left\{ \left( Z - \sqrt{\ln(Z)} \right) \frac{e_{s}^{2}}{4\pi\varepsilon_{0} \left( G_{s} m_{p} / c^{2} \right)} \right\} \pm 10.06 \text{ MeV}$$

$$\approx \left[ \left( Z - \sqrt{\ln(Z)} \right) * 20.12 \text{ MeV} \right] \pm 10.06 \text{ MeV}$$
where  $A \approx 2Z + 0.0063326(Z)^{2}$ 

See the following Figure 11 for the plotted (dotted) black curve compared with SEMF green curve.

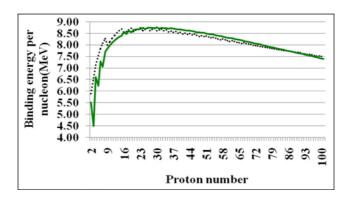

Figure 11: Nuclear Binding energy close to stable mass numbers of Z = 2 to 100

Let  $M_n$  be a possible magic proton number. Considering relations (23) and (24), it is possible to develop a relation of the following form having a factor (1/2).

$$M_{n} \cong \left\{ \frac{1}{2} \left[ 2.531 \left( n + \frac{1}{2} \right) \right]^{2} + 1 \right\} + \Delta$$

$$\cong \left[ 3.203 \left( n + \frac{1}{2} \right)^{2} + 1 \right] + \Delta$$

$$(25)$$

where, after rounding off,

if, 
$$\left\{ \frac{1}{2} \left[ 2.531 \left( n + \frac{1}{2} \right) \right]^2 + 1 \right\}$$
 is Odd,  $\Delta = \mp 1$   
if,  $\left\{ \frac{1}{2} \left[ 2.531 \left( n + \frac{1}{2} \right) \right]^2 + 1 \right\}$  is Even,  $\Delta = \mp 2$ 

See the following Table 7. It is possible to say that,

- 1) Magic proton numbers 2, (6), (14), 28, 50, 82, 114,.. etc [44-46] can be shown to be  $n^{th}$  levels.
- 2) Magic proton numbers 2, 8, 20, 40,... can be shown to be  $\left(n + \frac{1}{2}\right)$  levels.

**Table 7:** To understand the magic proton numbers

$\left(n+\frac{1}{2}\right)$	Round off $\left[3.203\left(n+\frac{1}{2}\right)^2+1\right]$	$M_{_{n}}$
0	1	1,2
0.5	2	2,4

#### 12. Discussion

1) With reference to the proposed characteristic mass unit of  $\sqrt{\hbar c/G_s} \cong 546.62 \text{ MeV}/c^2$ , basic baryonic mass spectrum can be fitted with the following relation,

$$m_{Bar}c^2 \cong \left(\frac{n}{\alpha_s}\right)^{\frac{1}{4}} \sqrt{\frac{\hbar c^5}{G_s}} \cong \left(\frac{n}{\alpha_s}\right)^{\frac{1}{4}} 546.6 \text{MeV}$$
 (26)

where n = 1, 2, 3, ...

See Table 8. For further details, readers are encouraged to see our published paper [33].

Table 8: Est	imated basic	baryons	rest	energy
--------------	--------------	---------	------	--------

n	Baryon rest energy ( MeV )	n	Baryon rest energy (MeV)
1	938.3	11	1708.7
2	1115.8	12	1746.3
3	1234.8	13	1781.6
4	1326.9	14	1814.9
5	1403.0	15	1846.5
6	1468.5	16	1876.5
7	1526.1	17	1905.2
8	1578.0	18	1932.6
9	1625.1	19	1958.9
10	1668.5	20	1984.2

- 2) So far no model could succeed in understanding nuclear binding energy with gravity [19]. It can be confirmed from main stream literature [1-20].
- 3) So far no model could address or succeed in implementing strong coupling constant in low energy nuclear physics.
- 4) So far no model could attempt to understand nuclear stability and binding energy with the combined effects of strong nuclear gravity and strong nuclear charge.
- 5) Understanding nuclear binding energy with a single energy coefficient of magnitude  $\frac{e_s^2}{8\pi\varepsilon_0 \left(G_s m_p/c^2\right)} \cong 10.09 \text{ MeV}$  is a challenging task and so far, except Ghahramany et al, no one could attempt to do that. It may also be noted that, in Ghahramany's model, energy constant is

- a variable [47] and in our model energy constant remains same for any nuclide.
- 6) Estimation of nucleon stability range is simple in our model compared to SEMF and Ghahramany's model. Interesting point to be noted is that, in our model, nucleon stability range or stable mass numbers can be estimated without considering the binding energy formula. We have provided different relations for understanding nucleon stability.
- 7) Proposed new and result oriented number

$$k \cong \left(\frac{4\pi\varepsilon_0 \hbar^2 m_e c^2}{4e^2 G_s m_p^3}\right) \cong 0.0063326$$

seems to play a

key role in understanding nuclear stability and binding energy vide relations (6), (7), (8), (9), (10), (16) and (20).

- 8) Proposed first tem is not new and proposed second term  $[(kA_sZ/2.531)+3.531]\times10.06$  MeV seems to play an excellent role in fitting and understanding the binding energy of medium and heavy stable nuclides. It can be evidenced form Table 3. Correction seems to be required for light atomic nuclides. It needs further study.
- Proposed third term  $\left[\left(A_s A\right)^2 / A_s\right] \times 10.06 \text{ MeV}$  seems to be approximate in fitting and understanding the binding energy of isotopes. We are working on it for its validity and better alternative with respect correct stable mass number of Z. For example, see the following Table 9.

**Table 9:** Binding energy of isotopes of Z = 8, 10 and 20

- 10) In deuteron, binding energy seems to be proportional to  $e^2$  and in other atomic nuclides, binding energy seems to be proportional to  $e_s^2$ .
- 11) Considering the average of  $(e^2, e_s^2)$  and without considering 0.71 MeV (as there exists only one proton), based on relation (22), binding energies of  ${}_{1}^{2}H$  and  ${}_{1}^{3}H$  nuclides can be estimated as,

$$\left[2-2^{\frac{1}{3}}\right]$$
 5.6  $\cong$  4.15 MeV and  $\left[3-3^{\frac{1}{3}}\right]$  5.6  $\cong$  8.72 MeV respectively.

12) Considering the average of  $(e^2, e_s^2)$  and considering 0.71 MeV (since there exists two protons), based on relation (22), binding energy of  ${}_{2}^{3}He$  can be estimated as,  $\left[3-3^{\frac{1}{3}}\right]4.9 \approx 7.63$  MeV.

13) Coulombic energy coefficient being 0.7 MeV, with reference to  $\ln\left(\frac{e^2}{4\pi\epsilon_0 G_s m_p m_e}\right) \approx 1.515$ , volume or surface energy coefficient can be expressed as 1.515\*10.09 = 15.3 MeV and asymmetric energy coefficient can be expressed as, 1.515\*15.3 = 23.0 MeV. Thus, 10.09 MeV, 15.3 MeV and 23.0 MeV seem to follow a geometric series with a geometric ratio of 1.515. For  $(Z \ge 10)$ , binding energy can also be estimated with,

$$B_A \cong (A - A^{2/3} - 1) * 15.3 \text{MeV}$$

$$-\frac{Z^{2}}{A^{1/3}}*0.7\text{MeV} - \frac{(A-2Z)^{2}}{A}*23.0\text{MeV}$$
 (27)

- 14) With advanced research in high energy nuclear physics, hadronic melting points can be understood and bare quarks can be made identifiable.
- 15) With further research in nuclear astrophysics, it is certainly possible to understand the combined effects of Newtonian gravitational constant and proposed nuclear gravitational constant. Considering the ratio of nuclear gravitational constant and Newtonian gravitational constant, estimated masses of white dwarfs, neutron stars and black holes [48,49], can be fitted approximately. For example,

$$M_{x} \approx \left(\frac{G_{s}}{G_{N}}\right) \sqrt{\frac{e^{2}}{4\pi\varepsilon_{0}G_{N}}} \approx 0.473M_{\odot}$$

$$M_{x} \approx \left(\frac{G_{s}}{G_{N}}\right) \sqrt{\frac{e_{s}^{2}}{4\pi\varepsilon_{0}G_{N}}} \approx 1.373M_{\odot}$$

$$M_{x} \approx \left(\frac{G_{s}}{G_{N}}\right) \sqrt{\frac{\hbar c}{G_{N}}} \approx 5.456M_{\odot}$$
(28)

$$M_{x} \approx \sqrt{\frac{G_{s}}{G_{N}}} \frac{e^{2}}{4\pi\varepsilon_{0}G_{N}m_{p}} \approx 0.023M_{\odot}$$

$$M_{x} \approx \sqrt{\frac{G_{s}}{G_{N}}} \frac{e_{s}^{2}}{4\pi\varepsilon_{0}G_{N}m_{p}} \approx 0.2M_{\odot}$$

$$M_{x} \approx \sqrt{\frac{G_{s}}{G_{N}}} \left(\frac{\hbar c}{G_{N}m_{p}}\right) \approx 3.174M_{\odot}$$
(29)

16) At the moment of a neutron star's birth, the nucleons that compose it have a temperature of around 10<sup>11</sup> to 10<sup>12</sup>K [50]. Equating a black hole's mass-energy density and thermal energy density [51,52,53], it is possible to show that,

$$T_{B} \cong 0.4615 \frac{\hbar c^{3}}{k_{B}G_{N}\sqrt{M_{B}M_{Pl}}}.$$
 (30)

where, 
$$M_{pl} \cong \sqrt{\frac{\hbar c}{G_N}} \cong 2.176 \times 10^8 \text{kg}$$

 $M_{\scriptscriptstyle R} \cong \text{Mass of blackhole}$ 

and  $T_{\scriptscriptstyle B} \cong$  Temperature of blackhole

This just resembles famous Hawking's Black hole temperature formula [54] with a change in its effective mass  $\sqrt{M_{\scriptscriptstyle B}M_{\scriptscriptstyle pl}}$ . With reference to relation (29), considering  $M_{\scriptscriptstyle X}$  as a critical mass for neutron stars and black holes, corresponding critical temperature can be fitted with,

$$T_{x} \approx \frac{\hbar c^{3}}{8\pi k_{\scriptscriptstyle B} G_{\scriptscriptstyle N} \sqrt{M_{\scriptscriptstyle B} M_{\scriptscriptstyle pl}}} \tag{31}$$

17) Quantitatively, Fermi's weak coupling constant [55] and electron rest mass can be fitted with the following relations.

$$G_{\scriptscriptstyle F} \cong \left(\frac{m_{\scriptscriptstyle e}}{m_{\scriptscriptstyle p}}\right)^2 \hbar c R_{\scriptscriptstyle 0}^2 \cong \frac{4G_{\scriptscriptstyle e}^2 m_{\scriptscriptstyle e}^2 \hbar}{c^3} \tag{32}$$

$$m_e \cong \sqrt{\frac{G_F c^3}{4G_e^2 \hbar}}$$
 and  $\frac{2G_s m_e}{c^2} \cong \sqrt{\frac{G_F}{\hbar c}}$  (33)

18) In a theoretical and verifiable approach, magnitude of the Newtonian gravitational constant can be estimated with nuclear elementary physical constants [56, 57]. For example, with reference to Planck scale, we noticed that,

$$\frac{\pi R_0^2}{\pi R_{ol}^2} \cong \frac{G_s^2 m_p^2}{G_N \hbar c} \cong \left(\frac{m_p}{m_e}\right)^{12}$$
(34)

where, 
$$R_0 \cong \frac{2G_s m_p}{c^2}$$
,  $R_{pl} \cong \frac{2G_N M_{pl}}{c^2} \cong 2\sqrt{\frac{G_N \hbar}{c^3}}$ 

$$\left(\frac{m_{_{p}}}{m_{_{s}}}\right) \cong \left(\frac{G_{s}m_{_{p}}^{2}}{\hbar c} \times \frac{G_{_{s}}}{G_{_{N}}}\right)^{\frac{1}{12}} \cong \left(\frac{e_{_{s}}G_{_{s}}}{eG_{_{N}}}\right)^{\frac{1}{12}}$$
(35)

$$G_{N} \cong \left(\frac{m_{e}}{m_{o}}\right)^{10} \left(\frac{G_{F}c^{2}}{4\hbar^{2}}\right) \cong \left(\frac{m_{e}}{m_{o}}\right)^{12} \left(\frac{G_{s}m_{p}^{2}}{\hbar c}\right) G_{s}$$
(36)

$$G_{F} \cong \left(\frac{m_{p}}{m_{e}}\right)^{10} \frac{4\hbar^{2} G_{N}}{c^{2}} \tag{37}$$

$$\left(\frac{m_{_{p}}}{m_{_{e}}}\right) \cong \left(\frac{G_{_{p}}c^{2}}{4\hbar^{2}G_{_{N}}}\right)^{\frac{1}{10}}$$
(38)

19) Another very interesting relation is,

$$\left(\frac{m_p}{m_e}\right)^{10} \cong \exp\left(\frac{1}{\alpha_s}\right)^2 \tag{39}$$

20) If, 
$$G_s \cong \frac{4\pi\varepsilon_0 h^2 c^2 m_e}{e^2 m_p^3} \cong 3.329561 \times 10^{28} \frac{\text{m}^3}{\text{kg.sec}^2}$$

$$\begin{cases} \alpha_s \cong 0.115194 \\ G_F \cong 1.44021 \times 10^{-62} \text{ J.m}^3 \\ G_N \cong 6.679856 \times 10^{-11} \text{ m}^3 \text{kg}^{-1} \text{sec}^{-2} \end{cases}$$
(40)

21) If 
$$\alpha_s \cong \left[ \sqrt{\ln \left( \frac{m_p}{m_e} \right)^{10}} \right] \cong 0.1153515$$
,

$$\begin{cases}
G_s \cong 3.327283 \times 10^{28} \text{ m}^3 \text{kg}^{-1} \text{sec}^{-2} \\
G_F \cong 1.43824 \times 10^{-62} \text{ J.m}^3 \\
G_N \cong 6.670719 \times 10^{-11} \text{ m}^3 \text{kg}^{-1} \text{sec}^{-2}
\end{cases}$$
(41)

22) With reference to the macroscopic Planck's constant and microscopic strong coupling constant, average values seem to be:

$$\begin{cases} \alpha_s \cong 0.115273 \\ G_s \cong 3.32842 \times 10^{28} \text{ m}^3 \text{kg}^{-1} \text{sec}^{-2} \\ G_F \cong 1.43922 \times 10^{-62} \text{ J.m}^3 \\ G_N \cong 6.675285 \times 10^{-11} \text{ m}^3 \text{kg}^{-1} \text{sec}^{-2} \end{cases}$$
(42)

- 23) Relations (34), (35) and (38) seem to indicate the direct role of  $G_N$  in microscopic physics. We are working on understanding their physical significance with respect to proton-electron mass ratio.
- 24) Our proposed assumptions seem to ease the way of understanding and refining the basic concepts of final unification [58, 59, 60].

#### 13. Conclusion

Liquid drop model, Fermi gas model, quantum chromodynamics and string theory models are lagging in implementing the strong coupling constant and gravity in basic nuclear structure. In this context, understanding and estimating nuclear binding energy with 'strong interaction' and 'unification' concepts seem to be quite interesting and needs a serious consideration at basic level. Even though they are semi empirical, section (3) and relations (6), (7), (8), (9), (10), (11), (20), (21), (24), (26), (27), (28), (29), (30), (31), (34), (35), (38), (39) and (42) can be considered as favorable or supporting tools for our proposed model. One very interesting point to be noted is that, our proposed model seems to SPAN across the Fermi scale and Planck scale. With further research, mystery of magic numbers can be understood and a unified model of nuclear binding energy and stability scheme pertaining to high and low energy nuclear physics can be developed.

#### Acknowledgements

Authors are very much thankful to Dr. N. Ghahramany and team for their intuitive and heuristic contributions in this most advanced field of nuclear research. Author Seshavatharam is indebted to professors shri M. Nagaphani Sarma, Chairman, shri K.V. Krishna Murthy, founder Chairman, Institute of Scientific

Research in Vedas (I-SERVE), Hyderabad, India and Shri K.V.R.S. Murthy, former scientist IICT (CSIR), Govt. of India, Director, Research and Development, I-SERVE, for their valuable guidance and great support in developing this subject. Authors are thankful to the anonymous reviewers for their kind and valuable suggestions in improving the quality of the paper.
